## Application Report

# Configuring and Operating PCM6xx0-Q1 as Audio Bus Controller

Pedro Gelabert Precision ADC

#### **ABSTRACT**

This application report describes the modes, input parameters, and register coefficients required to configure the PCM6xx0 devices as an audio bus controller.

Introduction www.ti.com

#### 1 Introduction

The PCM6xx0 device family includes the following high-performance, analog-to-digital converters (ADC):

- PCM6020 is a two-channel ADC
- PCM6x40: PCM6240 and PCM6340 are guad-channel ADCs
- PCM6x60: PCM6260 and PCM6360 are six-channel ADCs
- PCM6480 is a quad-channel ADC with a quad-channel digital pulse density-modulation (PDM) microphone input.

This family of devices features a flexible audio serial interface that allows the device to be configured as either a controller or target. This document describes the modes, input parameters, and register coefficients required to configure the PCM6xx0 devices as an audio bus controller.

#### 2 Controller Mode

For I<sup>2</sup>S-based digital audio communication protocols, the controller device generates the clocks: bit clock (BCLK) and word clock (WCLK) (or frame synchronization, FSYNC). Conversely, a target device receives the clocks: BCLK and WCLK (or FSYNC) from an external device. In many applications, a host processor with an advanced digital audio interface can act as the audio bus controller with the PCM6xx0 as a target device. However, having the audio ADC as the audio bus controller is advantageous in the following circumstances:

- The host processor or DSP cannot output or generate standard audio clocks. A standard audio clock is an integer multiple of the sample rate that generates the necessary audio serial interface (ASI) FSYNC and BCLK clocks. In this case, an external PLL multiplier generates the appropriate audio clocks.
- To easily synchronize multiple PCM6xx0 devices for simultaneous recording across all channels and devices. In this case, one PCM6xx0 device is configured as a controller to generate low-jitter ASI clocks.
- The host does not have a flexible TDM/ASI bus to generate system required audio clocks, but allows these clocks as input when configured as a target device.

The following sections describe the modes, input parameters, or register settings required to configure the device as an audio bus controller.

#### 2.1 Controller Mode Configuration Options

The PCM6xx0 supports two functional modes when configured as an ASI controller:

- Auto Clock Generation with Internal PLL enabled. Enabling the PLL allows the auto clock generator engine to generate a system clock that can be greater than the provided MCLK.
- Auto Clock Generation with internal PLL disabled. Disabling the PLL limits the system clock to the MCLK frequency.

The system clock feeds the decimation filters and all the digital signal processing blocks (biquad filters, digital volume control, high pass filters, and so forth). Disabling the PLL limits the amount of digital signal processing available. However, with the low-jitter PLL disabled, the performance of the ADC can be degraded based on the jitter from the external clock source. For devices configured as controller mode in high-performance applications, the recommended operating mode is to enable the PLL.

Configuring the PCM6xx0 as an ASI controller requires that GPIO (for example, GPIO1) be configured as the MCLK input in GPIO\_CFG0 (page 0, register 0x21, bits 7-4). The frequency of MCLK must be one of the supported frequencies or ratios supported by configuring the MCLK\_FREQ\_SEL frequency selection mode (page 0, MST\_CFG0 register 0x13, Bits 2-0), as shown in Table 2-1. Note that when using auto clock generation with internal PLL disabled, MCLK\_RATIO\_SEL (page 0, CLK\_SRC register 0x16, bits 5-3) must also be configured.

Table 2-1. MCLK Frequency Selection Mode with Supported Frequencies or Ratios

MCLK FREQUENCY SELECTION MODE	SUPPORTED FREQUENCIES OR RATIOS
MCLK_FREQ_SEL (page 0, MST_CFG0 register 0x13, bits 2-0)	12 MHz, 12.288 MHz, 13 MHz, 16 MHz, 19.2 MHz, 19.68 MHz, 24 MHz, 24.576 MHz
MCLK_RATIO_SEL (page 0, CLK_SRC register 0x16, bits 5-3)	64, 256, 384, 512, 786, 1024, 1536, 2304

#### 2.1.1 Auto Clock Configuration With PLL Enabled

The auto clock configuration engine requires four user-provided parameters to generate the proper ASI clocks when the device is configured in controller mode, as shown in Table 2-2.

Table 2-2. Required Input Parameters for Controller Mode Auto Clock Configuration With PLL Enabled

USER-PROVIDED PARAMETER	REGISTER
MCLK Frequency	Page 0, MST_CFG0 Register 0x13, Bits 2-0
Sampling Rate (FS) mode (multiple of 48 kHz or 44.1 kHz)	Page 0, MST_CFG0 Register 0x13, Bit 3
FS_RATE	Page 0, MST_CFG1 Register 0x14, Bits 7-4
FSYNC-to-BCLK Ratio	Page 0, MST_CFG1 Register 0x14, Bits 3-0

#### 2.1.1.1 Supported Sample-Rates

The supported sample-rates and BCLK to FSYNC ratios for multiples and sub-multiples of 48 kHz are shown in Table 2-3.

Table 2-3. Supported FSYNC (Multiples or Sub-multiples of 48 kHz) and BCLK Frequencies

BCLK-TO-		•	·	•	BCLK (MHz)			·	
FSYNC RATIO	FSYNC (8 kHz)	FSYNC (16 kHz)	FSYNC (24 kHz)	FSYNC (32 kHz)	FSYNC (48 kHz)	FSYNC (96 kHz)	FSYNC (192 kHz)	FSYNC (384 kHz)	FSYNC (768 kHz)
16	Reserved	0.256	0.384	0.512	0.768	1.536	3.072	6.144	12.288

2048	15.0528	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

#### 2.1.1.2 Example 12-MHz MCLK

For a 12-MHz MCLK, the following I<sup>2</sup>C script configures the PCM6xx0 as controller mode with GPIO1 as MCLK input for a 44.1-kHz or 48-kHz sampling rate:

```
w 90 21 a0 # configure GPIO1 as MCLK input
w 90 13 80 # configure device as master with MCLK
w 90 14 48 # FS = 44.1/48k BCLK/ratio = 256
```

#### 2.1.2 Auto Clock Detect With PLL Disabled

For the lowest power consumption, it can be desirable to disable the PLL and derive all clocks directly from MCLK. To disable the PLL in auto configuration mode, set bit 5 (AUTO\_MODE\_PLL\_DIS) in MST\_CFG0 (page 0, register 0x13). The required inputs for this mode are found in Table 2-5.

Table 2-5. Required Input Parameters for Controller Mode Auto Clock Configuration With PLL Disabled

USER-PROVIDED PARAMETER	REGISTER
FS MODE	Page 0, MST_CFG0 Register 0x13, Bit 3
FS_RATE	Page 0, MST_CFG1 Register 0x14, Bits 7-4
FS_BCLK_RATIO	Page 0, MST_CFG1 Register 0x14, Bits 3-0
MCLK_FREQ_SEL_MODE	Page 0, CLK_SRC Register 0x16, Bit 6
MCLK_RATIO_SEL	Page 0, CLK_SRC Register 0x16, Bits 5-3
MCLK_FREQ_SEL	Page 0, MST_CFG0 Register 0x13, Bits 2-0

#### 2.1.2.1 Supported Sample-Rates

Table 2-6 shows the supported sample-rates with the PLL disabled. As shown in Table 2-6, higher MCLK ratios allow the use of greater number or greater computation of digital processing blocks due to the greater availability of clocks in the system.

Table 2-6. Supported Sample Rates for Auto Clock Configuration With PLL Disabled

#### 2.1.2.2 Example

For a 24.576-MHz or 22.579-MHz MCLK, the following I<sup>2</sup>C script configures the PCM6xx0 as controller mode with GPIO1 as MCLK input for the 48-kHz or 44.1-KHz sampling rate, respectively:

```
w 90 13 a0 # enable master mode, disable PLL for auto-clock config
w 90 14 48 # FS = 44.1/48k BCLK/fsync ratio = 256
w 90 16 d8 # MCLK is audio root, use MCLK_ratio_sel, MCLK/Fsync ratio = 512
w 90 21 a0 # configure GPI01 as MCLK input
```

## 3 Edge Sync for I<sup>2</sup>S and LJF in Controller Mode

In controller mode, the FSYNC edge is synchronous to the rising edge of BCLK. However, standard I<sup>2</sup>S/LFJ bus format expect the FSYNC edge to be synchronous to the falling edge of BCLK. Figure 3-1 and Figure 3-2 show the timing diagrams supported by PCM6xx0 in I<sup>2</sup>S and LJF mode, respectively. Note the standard I<sup>2</sup>S and LJF expect the FSYNC edge one clock cycle later than that produced by the PCM6xx0. To support standard I<sup>2</sup>S and LJF bus formats, the following sections show configuration options to provide compatibility in controller mode.

Figure 3-1. Default I<sup>2</sup>S in Controller Mode (TX\_Offset = 0) Showing Incompatible FSYNC Edge Sync

Figure 3-2. Default LJF Format in Controller Mode (TX\_OFFSET = 0) Showing Incompatible FSYNC Edge Sync

#### 3.1 Compatibility With Non-zero Offset

If the system can accommodate an additional offset for I<sup>2</sup>S or LJF format, the addition of an non-zero offset to the ASI bus of PCM6xx0 device allows compliance to either standard. If used in a system with other audio devices, these other devices would also need to accommodate this offset. To add a non-zero offset, configure the following registers:

- BCLK POL (Page 0, ASI CFG0 Register 0x07, Bit 2) = 1
- TX\_EDGE (Page 0, ASI\_CFG0 Register 0x07, Bit 1) = 1

These settings change the base offset from the I<sup>2</sup>S and LJF formats to 1. Additional offsets can be achieved by using the TX\_OFFSET (Page 0, ASI\_CFG1 Register 0x08, Bits 4-0).

### 3.2 I<sup>2</sup>S Compatibility With Zero Offset (I<sup>2</sup>S only)

PCM6xx0 devices can comply with the I<sup>2</sup>S bus format with zero offset by modifying the default left justified format to fit the I<sup>2</sup>S format requirements, as follows:

- BCLK POL (Page 0, ASI CFG0 Register 0x07, Bit 2) = 1
- TX EDGE (Page 0, ASI CFG0 Register 0x07, Bit 1) = 1
- ASI\_FORMAT (Page 0, ASI\_CFG0 Register 0x07, Bits 7-6) = 2'b10 (LJF format)
- FSYNC\_POL (Page 0, ASI\_CFG0 Register 0x07, Bit 3) = 1

Note that the first three bit fields configure the device in LJF mode with a  $TX_OFFSET = 1$  as in Section 3.1. The fourth bit field flips the polarity of FSYNC to match the  $I^2S$  protocol.
